Longline gradient in photoshop

In this tutorial, we will work with Photoshop's right-click feature and its various context menus to manipulate images while working with layers. Step 1: Download the Image Download the image we're working with and open it in Photoshop. Start by editing the layers in the image; add a new layer, and fill it with a solid color of your choice. (I used #F2F2F2) Step 2: Control the Layer With the layer selected, use the Control brush to make color changes or other edits. Right-click in the Layers panel; the options you get depend on what type of edits are being made. 1. Change the color The RHT/Left-click a new color to apply it to the whole selection of the layer or the layer itself. 2. Make the Layer Opaque The Opaque/O layer option in the menu bar lets you make the layer transparent so that the color of the layer and the background are visible. The transparent color of your layer is replaced with the color on the background. 3. Apply an Overlay Use the Overlay/Merge Overlay option to create one or more overlays. In this image I made a soft gradient overlay by drawing a new layer above the original layer. 4. Adjust a Layer's Opacity The Layer/Fill Opacity menu gives you a color picker that allows you to change the opacity or transparency of each layer. Click on a layer's opacity to see its Opacity/Fill Opacity options in the menu. Step 3: Control the Image Use the layers of an image to create effects that make it unique. A. You can duplicate layers to move them around. Simply select the layer and hit the Ctrl/Cmd + D key combination. Or select the layer and click the Select/Move tool. B. With the image selected, it is possible to make sure you are viewing the layer in correct perspective. Use the Control/R/scroll wheel or the Zoom tool to view the image from different angles. C. When you are creating a new image, you can use the editing tools from the control panel in the Layers panel to create a new layer, duplicate layers, or change the blending modes of the layer. Step 4: Control the Image D. To create a new layer, hit the Alt/

Reflection The reflection tool is a powerful tool which allows you to add reflections and refractions to images. Reflections add optical effects to a given image, allowing you to focus the attention of an audience. Refractions add a dreamlike quality to an image. Adjustment Layers Adjustment Layers allow you to edit adjustments or brushes using a light pen. Layers make it easier to edit and manipulate layers, and can create 3D effects. Erase Tool With the Eraser Tool, you can erase unwanted parts of an image. People Pixelmator allows you to turn photos into 3D objects, a technique known as 3D Pixelmator. The algorithm used for this process calculates depth as the project progresses. Paint The Paint Tool enables you to create patterns, textures, and other custom effects. You can either use the paint brush, the airbrush tool, or the paint roller. This type of tool is also called the Wacom Pen tool. Gimp GIMP is one of the most popular pixel editors for Mac and Windows. It's freely available for both platforms and it has a lot of features including adjustment layers, a built-in 3D tool, image filters, and tools for cropping images. Pixelmator Pixelmator is the Mac and iPad version of the same Photoshop. Unlike Photoshop, it does not require a computer to run or an internet connection. And its interface is quite intuitive and easy to use. Why It's So Important to Use Efficient Time Management Have you ever tried to start a project? Whether it be a book, a blog, or an entire business, they all require time and energy. You can't just suddenly show up and "crank out" the project. The writing process takes years of practice and practice – and time. If you're just starting out and your to-do list is far longer than the time you have, your chances of completing a task you've put on that list are slim. But if you were to prioritize that list into tasks that you can complete this week, this month, and eventually this year, you'd have a much better chance of accomplishing your goals. Looking back at what you've accomplished in the past, you'll see that your poor time management skills were a key factor in creating so much chaos.

Q: Convert a column with strings to variables or constants I have a large dataframe with different grades for each row. I want to use it in some calculations like averaging the grades, getting the best grades, etc. The columns are like: Grade A + A - B + C - D A + A - B + D Now I want to convert the strings in a column to variables or constants, like: $A + $A - $B + $C - $D $A + $A - $B + $D the '+' and '-' are variables for the grade. Is this possible? I have tried a code with openpyxl but it does not work for large dataframes. my code is w_sheet_names = ws.worksheet_names import openpyxl import sys def df2csv(df): """Converts df into a csv file""" df.to_csv(sys.stdout) return # Get the sheets from the file ws = Workbook.open(r'C:\Users\XXX\Desktop\example2.xlsx') # Loop over the sheets in the file for sheet_name in ws.worksheet_names: # Get the cells from the sheets ws[sheet_name] = ws[sheet_name].values # Loop over rows of the first sheet for row in ws[sheet_name].rows: # Loop over the column for col in row: # If the cell contains a number, change it to text if isinstance(col.value, float): col.value = str(col.value) else: pass # Change the date format to numbers col
